Job Overview

We are looking for enthusiastic freshers, to work on AI Workflow Engineer to design, develop, and optimize intelligent automation pipelines using no-code/low-code platforms and custom development frameworks. The role involves building scalable AI-driven workflows, integrating APIs, and developing automation systems that enhance operational efficiency and data intelligence.

Key Responsibilities

- **Must have Design and build automation workflows using platforms such as n8n, Make.com, Clay, or similar tools**
- Strong hands-on expouser in developing backend automation scripts using Python
- Develop AI-powered workflow solutions integrating LLM APIs and external AI services
- Configure triggers, conditional logic, and multi-step automation processes
- Integrate REST APIs, webhooks, and third-party applications
- Build data enrichment and CRM synchronization workflows
- Monitor, troubleshoot, and optimize workflow performance

Required Technical Skills

- Good knowledge of **workflow automation concepts**
- Proficiency in **Python coding**.
- Familiarity with **AI tools, LLM integrations, or prompt engineering**

- Understanding of data pipelines and automation logic
 - Strong analytical and problem-solving skills.
-

Pre Screening Question:

1. Have you used any automation tools like n8n, Make.com, clay, or similar?
2. Have you worked with any AI tools or ChatGPT API before?
3. What is an API in simple terms?
4. Why are you interested in AI automation?
5. What is the difference between manual work and automation?
6. What is a webhook in simple terms?
7. Why do companies use automation instead of hiring more people?
8. What is prompt engineering?
9. What is the difference between a trigger and an action in automation?
10. Why do you want to work in AI automation instead of core development?
11. Tell me about the last technical skill or tool you learned on your own, how did you learn it and what challenges did you face?
